Abstract

(Received September 6, 1983)

It has been said that soaps induced dry skin by washing off the skin surface Lipid and N.M.F. (natural moisturizing factor). And doctors had a tendency to advise their patients using so-called 'hypo-irritant soaps'.

In this usage test in 107 skin disease patients, we examined "BIOSOFT" which was considered to be equal to so-called 'hypo-irritant soap' as to the primary irritant and moisturizing capacity in our previous paper. We measured skin conditions and feeling at using of "BIOSOFT".

The results were as follow:

- 1) BIOSOFT did not interfere the treatment of the skin diseases.
- 2) From the answers of questionnaires, patients had good feeling such as smoothness of skin surface, wetness of the stratum corneum.
