Lanolin

Hisatoshi SHIMIZU*

Abstract

Lanolin has been widely used for cosmetic products and base for pharmaceutical ointments but recent trend is to stop using lanolin for these due to contact skin allergy caused by lanolin. However lanolin is one of the useful raw materials for cosmetics and base for pharmaceutical ointments.

Many researches have been done so that lanolin can be used safely. Researches have been clearing up substances causing lanolin allergy. A research on non-allergenisation of lanolin has completed.

Hypo-allergenic lanolin is on the market now and it is expected that non-allergenic lanolin derivatives will be on the market by researches on increasing safety of lanolin derivatives.
