Development of Cosmetics for Sensitive Skin Focusing on Barrier-Care

Masayuki KIKUTA*

Abstract

We have been conducting sensitive skin research for more than 50 years, when sensitive skin was not well known. The vulnerable stratum corneum barrier condition peculiar to sensitive skin is easily affected by various internal and external factors such as dryness, ultraviolet rays, pollen, air pollutants, and stress. And latest studies have also suggested that it is associated with temperature differences and skin-resident bacteria. In this paper, we will discuss our development of cosmetics for sensitive skin, which has been evolving by conducting research and development focusing on the vulnerable skin barrier unique to sensitive skin.

Key words: sensitive skin, barrier function, skincare, d program.
